Business Profile

Web Application Development & System Integration

Enigmatic Solutions

202603238746 (IP0632111-X)

[Pembangunan, Migrasi Data, Integrasi, Pengujian dan Pelaksanaan Sistem SKIM / CLAB/SKIM/TENDER/2026/01]

October 2026

SECTION 1

Company Overview

We design, build and maintain custom web-based business systems, with a track record of delivering operational platforms for Construction Labour Exchange Centre Berhad (CLAB).

Company particulars

Company / business name	Enigmatic Solutions
SSM registration no.	202603238746 (IP0632111-X)
Date established	09-09-2026
Registered address	A-3A-7, Apartment Sri Cempaka, Jalan Sepakat Indah 2/1, Taman Sepakat Indah, 43000 kajang, Selangor
Contact person & designation	Muhammad Hafiz Bin Harun
Telephone / e-mail	013-2621525 / enigmaticsolition26@gmail.com

What we deliver

Custom business systems

End-to-end web applications that digitise manual processes: submissions, approvals, tracking, reporting and case closure.

Online payment & billing

Payment gateway integration (FPX / online banking), automated invoicing, tax invoices and receipts, and payment status reconciliation.

Integration with existing systems

Connecting new applications to legacy databases and third-party services through secure APIs and webhooks.

Access control & audit

Role- and permission-based access, activity logging and e-mail delivery tracking for accountability.

Reporting & dashboards

Management dashboards with charts and KPIs, plus exports to PDF, Excel and CSV.

Automation & notifications

Scheduled jobs for reminders, deadlines and penalties; automated e-mail notifications at every workflow stage.

Track record at a glance

#	SYSTEM	PURPOSE	CLIENT
1	**e-Salary**	Payroll submission and online payment collection portal	CLAB
2	**e-Booking**	Meeting room, IT asset and vehicle booking with fleet management	CLAB
3	**e-Tuntutan**	Foreign worker insurance claim management	CLAB
4	**Sistem Aduan**	Complaint and helpdesk ticketing system	CLAB

SECTION 2 · PROJECT EXPERIENCE

01 e-Salary

Payroll submission and online payment collection portal

CLIENT	USERS	SCALE
CLAB	**Contractors, admin, finance, management**	**34 data models · 19 service modules**

e-Salary lets contractors who employ foreign construction workers submit monthly timesheets and overtime, receive an invoice calculated by the system, and pay online. CLAB staff monitor submissions, payments and outstanding amounts across all contractors from a single portal.

Key features

- **Monthly timesheet and overtime entry** per worker, with Excel import and automatic submission at the deadline.
- **Salary calculation engine** following Malaysian regulations: EPF by percentage, SOCSO from the official contribution table, and overtime at weekday, rest day and public holiday rates.
- **Unpaid leave and pro-rating** calculations, salary adjustments and worker deductions with signed deduction forms.
- **Online payment through Billplz** (FPX), with gateway callbacks and scheduled status synchronisation.
- **Pro forma invoices, tax invoices and receipts** generated as PDF.
- **Overdue penalties and payment reminders** applied and sent automatically.
- **Five user roles** (super admin, admin, finance, management, client) with separate dashboards.
- **Management dashboard** showing revenue KPIs, collection health and trends.
- **Missing submission tracking** to identify contractors who have not submitted.
- **Integration with the existing worker database** on a read-only connection, plus an API for an external payslip system.
- **Transactional e-mail via Brevo** with delivery tracking through webhooks and a searchable e-mail log.
- **Activity log, per-contractor configuration** and submission windows, news announcements, and a guided on-screen tutorial for new users.
- **Excel exports** for payroll, payments, overtime and worker listings.

Technology

Laravel 12 · PHP 8.2 · Livewire 3 · Flux UI · Tailwind CSS 4 · MariaDB / MySQL · Billplz · Brevo API · DomPDF · Laravel Excel · Queues & scheduler

SECTION 2 · PROJECT EXPERIENCE

02 e-Booking

Resource booking and vehicle fleet management system

CLIENT	USERS	SCALE
CLAB	**Staff, admin, super admin**	**19 data models · 3 asset types**

e-Booking is an internal system for reserving shared company resources: meeting rooms, IT equipment and vehicles. It replaces manual booking with a calendar-based workflow and adds a full record of how each vehicle is used and maintained.

Key features

- **Booking of three asset types** (meeting rooms, IT assets, vehicles) from one interface.
- **Interactive calendar** with drag-and-drop, showing bookings and vehicle events.
- **Booking status workflow** with e-mail notifications when a booking status changes.
- **QR codes for each asset**, scanned by staff to complete a booking on site, with a scan log.
- **Automatic reminders** for incomplete bookings, with configurable reminder settings.
- **Favourite assets** for quicker repeat bookings.
- **Vehicle fleet management:** fuel logs, odometer readings, maintenance records and inspection check-ups using configurable templates.
- **Vehicle analytics** with exportable reports.
- **Reports** in PDF, Excel and CSV, with a history of generated reports.
- **Granular roles and permissions** for users, roles, bookings, assets and vehicles.
- **Announcements** with images and read tracking.
- **Dashboard** with booking statistics and charts.

Technology

Laravel 12 · PHP 8.2 · Livewire + Volt · Flux UI · Tailwind CSS 4 · Spatie Permission · Schedule-X calendar · Chart.js · QR code generation · DomPDF · PhpSpreadsheet

SECTION 2 · PROJECT EXPERIENCE

03 e-Tuntutan

Foreign worker insurance claim management system

CLIENT	USERS	SCALE
CLAB	**Employers, persons-in-charge, admin**	**10 data models · 9 notification types**

e-Tuntutan manages insurance claims for foreign workers from the employer's first submission through insurer review, payment to beneficiaries and case closure. It gives CLAB officers and employers a shared, up-to-date view of every claim.

Key features

- **Three claim types** in one workflow: insurance (Foreign Worker Hospitalisation Scheme), Green Card and PERKESO.
- **Online claim submission** by employers, with worker details and document upload.
- **Configurable document checklists** per claim type, for example hospitalisation and death claims.
- **Review and decision workflow**, including forwarding a rejected claim to another scheme.
- **Appeal process** for rejected claims.
- **Payment tracking** through to disbursement to beneficiaries.
- **Automated e-mail notifications** at each stage: submission, missing documents, sent to insurer, insurer decision and status changes.
- **Claim form generated as PDF** from data entered in the system.
- **Colour-coded status dashboard** (open, in progress, closed).
- **Notes and e-mail history** recorded against each claim.
- **Role-based access** for admin, person-in-charge and employer, with role and permission management.
- **Secure document storage**, with downloads restricted to authorised users.

Technology

Laravel 12 · PHP 8.2 · Livewire 4 · Flux UI · Tailwind CSS 4 · MySQL / MariaDB · Spatie Permission · DomPDF · Laravel Notifications

SECTION 2 · PROJECT EXPERIENCE

04 Sistem Aduan

Complaint and helpdesk ticketing system

CLIENT	USERS	SCALE
CLAB	**Staff, admin**	**9 data models · 9 notification types**

Sistem Aduan records and tracks complaints received by the organisation. Each complaint becomes a numbered ticket that is routed to the right department, assigned to staff, and followed until it is resolved and closed.

Key features

- **Ticket registration** with automatic running numbers (for example TKT-2026-00001).
- **Classification** by sector, department, category, priority and the channel the complaint came through.
- **Assignment to one or more staff**, with notification to each assignee.
- **Seven-day resolution target** with days-remaining and overdue indicators.
- **Scheduled reminders** for overdue and long-running tickets.
- **Replies and file attachments** on each ticket.
- **Full activity log** for each ticket, from creation to closure with closing remarks.
- **Public status page** linked from e-mail, so a complainant can check progress without logging in.
- **E-mail notifications** when a ticket is created, assigned, replied to, resolved and closed.
- **Dashboard with charts** summarising ticket volume and status.
- **Administration screens** for users, sectors, departments and categories.
- **Role-based access** and form protection against automated submissions.

Technology

Laravel 12 · PHP 8.2 · Livewire 3 · Flux UI · Tailwind CSS 4 · Spatie Permission · Chart.js · Laravel Mail & scheduler

SECTION 3

Technical Capability

The same core stack is used across all four systems, which keeps them consistent to operate, secure and maintain.

Technology stack

Back end	PHP 8.2, Laravel 12, queues and task scheduler
Front end	Livewire 3 and 4, Volt, Flux UI, Tailwind CSS 4, Vite, Chart.js, Schedule-X calendar
Database	MySQL / MariaDB, including multi-database connections to legacy systems
Payments	Billplz payment gateway (FPX)
E-mail	Brevo transactional e-mail API with delivery webhooks; Laravel Mail and Notifications
Documents & reports	PDF generation (DomPDF), Excel and CSV (Laravel Excel, PhpSpreadsheet), QR codes
Security	Role and permission-based access (Spatie Permission), e-mail verification, CSRF protection, activity and audit logs
Quality	Automated tests with Pest PHP, Laravel Pint code style, Git version control

Capabilities demonstrated across the four systems

CAPABILITY	E-SALARY	E-BOOKING	E-TUNTUTAN	ADUAN
Role-based access control	Yes	Yes	Yes	Yes
Automated e-mail notifications	Yes	Yes	Yes	Yes
Dashboard and statistics	Yes	Yes	Yes	Yes
Scheduled reminders / background jobs	Yes	Yes	-	Yes
PDF document generation	Yes	Yes	Yes	-
Excel / CSV export	Yes	Yes	-	-
File upload and secure document storage	Yes	Yes	Yes	Yes
Online payment gateway	Yes	-	-	-
External system / API integration	Yes	-	-	-
QR code workflow	-	Yes	-	-
Activity / audit trail	Yes	Yes	Yes	Yes

SECTION 4

Why Us for SKIM 2.0

We have already inspected SKIM, we already build on the platform SKIM 2.0 needs, and we have already delivered four working systems to CLAB on it.

170,446	2011	4	1
lines of SKIM code we reviewed in our technical assessment	year security support ended for the software SKIM runs on	systems we have already built for CLAB	technology platform across all four, ready for SKIM 2.0

Our technical risk assessment of SKIM v3.0 (8 September 2026) found that the system cannot be brought up to date by patching. It is tied to a version of PHP and a framework that have had no security fixes for 15 years, and moving it to supported software means rewriting its data layer, its login and all 59 of its program files. The assessment also identified critical weaknesses in login security, password storage and public exposure, which we have reported to CLAB separately. Replacement is the only route to supported software.

Five reasons to appoint us

1 **We already know SKIM from the inside**

We have maintained SKIM for CLAB for three years and have assessed its code and server configuration in full. We know its size, its structure and where its problems are, so the scope and the risks of the rebuild are understood before work begins.

2 **We already build on the platform SKIM 2.0 needs**

SKIM 2.0 has to run on current, supported software. All four systems in this profile are built on Laravel 12 and PHP 8.2, the current supported versions. There is no learning curve and no experimental technology.

3 **We have already worked with CLAB's worker and contractor data**

e-Salary connects to CLAB's existing worker database, and e-Tuntutan manages claims against worker records. We understand how workers, contractors and payments relate to each other in CLAB's operations.

4 **One consistent platform for CLAB**

SKIM 2.0 would share the same technology, the same screen design and the same access model as e-Salary, e-Booking, e-Tuntutan and Sistem Aduan. Staff see a familiar interface, and CLAB maintains one technology instead of several.

5 **What SKIM lacks, we have already delivered elsewhere**

Protected logins, role-based access, audit trails, reliable e-mail, mobile-friendly screens and tested releases are standard in the systems we have built for CLAB. The next page maps each SKIM 2.0 requirement to where we have done it.

SECTION 4 · WHY US FOR SKIM 2.0

Proven Against the SKIM 2.0 Requirements

Each requirement below comes from our SKIM assessment. The right-hand column shows where we have already delivered it for CLAB.

REQUIREMENT	SKIM TODAY	ALREADY DELIVERED BY US
Secure login	Passwords stored as readable text; no session timeout	Hashed passwords and session expiry in all four systems
Access control	Users can raise their own access level	Server-side roles and permissions in all four systems; five separate roles in e-Salary
Supported platform	No security fixes since 2011	Laravel 12 and PHP 8.2 in all four systems
Audit trail	Cannot prove who did what	Activity log in e-Salary; per-ticket and per-claim history in Sistem Aduan and e-Tuntutan
Uploaded documents	Copied between two servers once a day	Documents stored once and served only to authorised users in e-Tuntutan and e-Salary
E-mail notifications	Fail without anyone being told	Delivery tracking and a searchable e-mail log in e-Salary; e-mail history per claim in e-Tuntutan
Mobile use	Not usable on a phone or tablet	Responsive screens in all four systems; QR scanning from a phone in e-Booking
Data entry	A failed check discards what was typed	Errors shown beside the field with the entry kept, in all four systems
Safe changes	No version control; files copied and dated	Git version control on all four systems
Testing	Changes proven on live data	Automated test suites in all four systems

What we commit to for SKIM 2.0

- One system and one codebase, replacing the two separate servers.
- A proper domain with HTTPS enforced, and a database that is not reachable from the internet.
- Two-factor authentication for administrators.
- Migration of existing SKIM data, checked against the old system before go-live.
- A staging environment, so nothing is tested on live worker data.
- Documentation, user training and handover, so the system does not depend on one or two people.

SECTION 5

Our Advantage Over Other Bidders

Three things we bring to SKIM 2.0 that a vendor new to CLAB cannot.

3 years	4 systems	3 months
working closely with CLAB and maintaining SKIM 1.0	built by us and connected directly to SKIM 1.0	to develop SKIM 2.0

1 **Three years with CLAB, and four systems already connected to SKIM**

We have worked closely with CLAB for three years and built e-Salary, e-Booking, e-Tuntutan and Sistem Aduan, all of which connect directly to SKIM 1.0. When SKIM is replaced, every one of those connections has to be moved to the new system. We built both sides, so we can move them without disrupting daily operations, and CLAB keeps a single team responsible for SKIM 2.0 and the four systems that depend on it.

2 **Deep knowledge of SKIM 1.0's code and database**

We have maintained SKIM 1.0 for three years. We know its code, its database structure and the business rules that are written nowhere except in the system itself. That knowledge is what makes data migration accurate and makes sure no existing function is left out of SKIM 2.0.

3 **SKIM 2.0 developed in three months**

We can develop SKIM 2.0 in three months because we do not need a discovery phase. The existing system is already understood, the platform is the one we use for CLAB's other systems, and components such as login, roles and permissions, notifications, document handling and reporting are already built and proven there.

How this compares with a vendor new to CLAB

AREA	A NEW VENDOR	US
Knowledge of SKIM 1.0	Must first study a large, undocumented system	Three years maintaining its code and database
Connected systems	Must learn four other systems, or rely on us to change them	We built all four and will update them as part of the work
Data migration	Has to work out the database structure and its exceptions	Already familiar with the data and its history
Understanding of CLAB	Starts with requirements workshops	Three years of working with CLAB's staff and processes
Development time	Includes time to learn before building	Three months
After go-live	SKIM 2.0 and the four systems under different vendors	One team for SKIM 2.0 and all four systems
